

Update your Pfaff creative vision™

We strongly recommend you always update your CREATIVE VISION™ with the latest software version.

Improvements:

The new software version contains a lot of improvements. These are all made upon consumer requests. Thank you for your feedback and ideas! Please continue to give us your suggestions; they are very helpful in our work with making the best sewing and embroidery machine in the world.

Save time

- If a tie-off is done in embroidery mode and there is no cut is following, your CREATIVE VISION™ will not slow down. This will save you a lot of embroidery time and will be very beneficial when sewing an embroidery created with the built-in stitches and the shaping feature.
- When you're done with your editing in embroidery edit and want to switch over to embroidery stitch out mode, the switching time will be reduced around 20%, which will make it faster to start embroidering.

Needle thread – stop

If the machine stops due to a needle thread breaking, the presser foot will stay down on the fabric to keep your project in place and the needle will go up to make it easy to rethread.

Stitch creator – recommendations

In Stitch Creator you can create completely new stitches or edit the built-in stitches. As you are the designer and creator of the stitch and the CREATIVE VISION™ doesn't have any data about that specific stitch, the machine doesn't know which presser foot to show in the recommendation field. Therefore the CREATIVE VISION™ doesn't show any presser foot or stabilizer recommendation. You need to know what kind of stitch you have created and select a proper presser foot for your stitch.

Grouping of designs – resize

Grouping is a great feature to be used in embroidery mode. When the selected designs are grouped together, all adjustments will affect all designs in the group, which means that you do not need to do the same adjustments on every single design. With the new software update the CREATIVE VISION™ keeps the grouped designs grouped together also after an adjustment such as resize is done.

Electronic knee-lift functionality

The electronic knee-lift is a feature of the CREATIVE VISION™ that a lot of Pfaff consumers, especially quilters appreciate. Responding to a request from several consumers, we have changed the functionality of electronic knee lift. When using the knee lift with the needle down position the presser foot will first lift to the pivot position and then to the high position and it will always keep the needle down in the fabric to keep the project in place.
